Release Note

Cegid Retail Y2 Avalara Tax Connector

cegid

Document follow-up

Date	By	Comments
27/06/2024	Cegid	Updates published with package 24.0.3
21/08/2024	Cegid	Updates published with package 24.0.4
02/09/2024	Cegid	Multi-settings evolution on version 0.112
22/04/2025	Cegid	Multi-settings evolution on version 0.121
30/05/2025	Cegid	Updates published with package 25.0.2. Enhanced to support default customer from the settings, added country and jurisdiction field in the response.
23/10/2025	Cegid	Updates published on version 0.159 with package 25.0.4

Preamble

This module is a set of web services associated with one or more versions of Cegid Retail Y2.
This document describes its scope of implementation, as well as the changes and corrections made.
Please note: All module methods and services can be cited in this document. Only public methods for which the contract is published can be used by applications not designed by Cegid.

Legal notices

Permission is granted under this Agreement to download documents held by Cegid and to use the information contained in the documents only internally, provided that: (a) the copyright notice on the documents remains on all copies of the document; material; (b) the use of these documents for personal and non-commercial use unless it has been clearly defined by Cegid that certain specifications may be used for commercial purposes; (c) documents will not be copied to networked computers or published on any type of media unless expressly authorized by Cegid; and (d) no changes are made to these documents.

1. INTRODUCTION

The TaxEngine plugin is a component which allows web-based apps such as MPOS, Live Store and external applications (using the SalesExternal web services) to calculate the correct tax to apply to sales. This plugin can optionally communicate with Avalara through a connector to calculate sales tax, instead of using the standard Y2 tax engine. This document describes that connector.

Avalara is a software solution for automated tax compliance. They deliver real time geospatial location sales tax rates to the Y2 POS during sales and optionally saves POS sales transactions to Avalara for use in Avalara services. See https://www.avalara.com/

Please note that this document only describes the Avalara Tax Connector used through the TaxEngine and does not cover the scope of the CBS module designed to use the Avalara from the Y2 Front Office and Back Office applications.

Disclaimer:

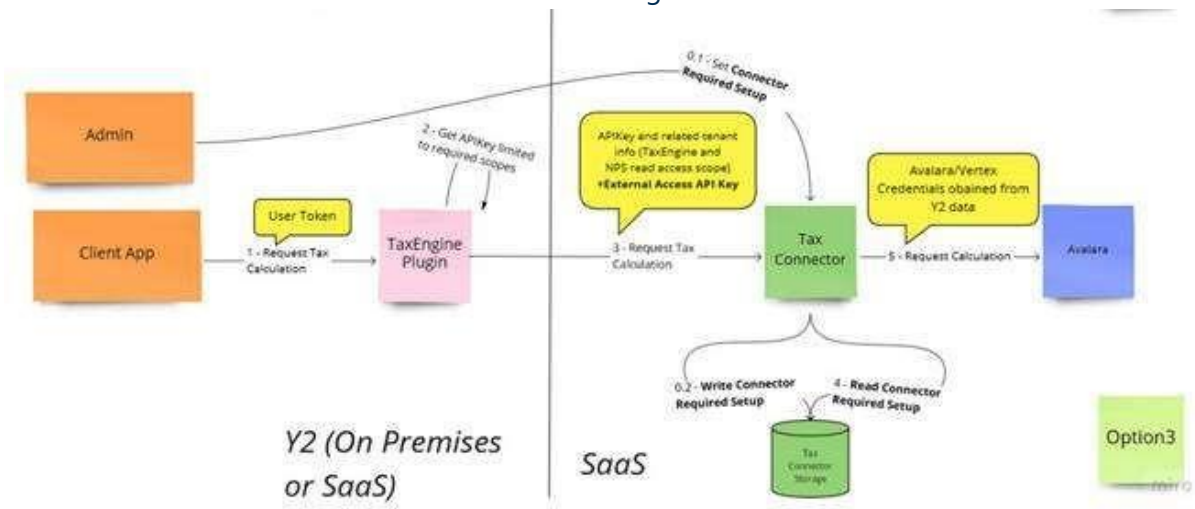
When it comes to Tax management, it is important to note that Cegid cannot provide tax expertise or recommendations for its customers. It remains the customer's responsibility or the responsibility of their Tax auditor/expert to provide the rules and settings for the tax calculation.

With this solution, Cegid provides tax technology for retailers to facilitate the implementation of their rules based on Tax data content provided by Avalara.

Retailers may wish to leverage our functions to collect sales on the various sales and manage their tax remittance via Avalara services

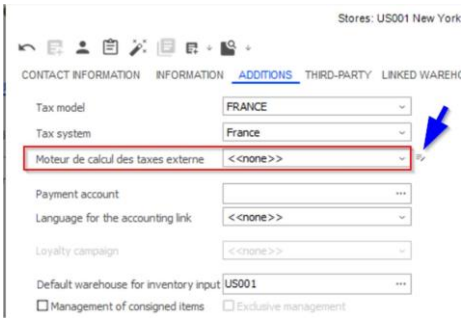
2. ARCHITECTURE

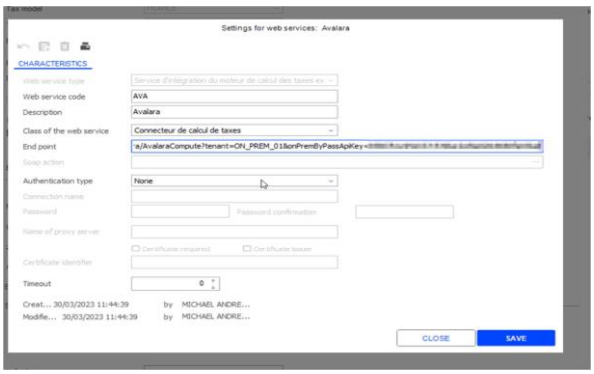
The architecture of the solution is detailed in the diagram below:



The TaxEngine plugin is installed as part of the Y2 Core modules.

The TaxEngine must be configured on the Y2 BackOffice to communicates with the Tax Connector component, which in turn communicates with Avalara to obtain the relevant tax information.





/!\ Important: If the Y2 instance is OnPrem, a “dedicated OnPrem tenant” needs to be obtained from Cegid for the Tax Connector to be accessed from the OnPrem TaxEngine.

3. Avalara Connector Settings Endpoints

Avalara Connector Upsert Settings Endpoint

SaaS instance environment
POST https://retail-connectors.cegid.cloud/[et or t or ep or p]/avalara/UpsertSettings?tenant=[TENANT] &profile=[PROFILENAME]
OnPrem instance environment
POST https://retail-connectors.cegid.cloud/[et or t or ep or p]/avalara/UpsertSettings?tenant=[TENANT]&onPremByPassApiKey=[APIKEY]&profile=[PROFILENAME]

These calls are used to define or update the connector settings.

The values to use for [TENANT] and [APIKEY] will be provided by Cegid. [TENANT] is the tenant identifier and APIKEY only has a purpose for OnPrem installations.

The connectors support multiple settings profiles within a single tenant. By defining multiple profiles, businesses can customize tax configurations per profile, ensuring the correct tax settings are applied for each transaction. The [PROFILENAME] value defines the profile targeted for the operation (Upsert, Get and Compute call). Its absence will target the default settings.

Settings body description

Field	Content
companycode	Company code provided by Avalara
user,Password	Username and password provided by Avalara
IsSandbox	true/false depending on whether you are connecting to a test environment

SecurityKey,SecurityKeyValue	If you are using tokenization to connect to Avalara, then your Avalara contact may provide you with a security key to use in addition to your username and password. If so, then the key and the value need to be filled out here.
TrustedId	Avalara may also provide you with a Trusted ID which you can use instead of a username and password. If this is the case, then you can enter this here
PutCustomDataUrl	Certain customers may wish to use an external database to store the tax information which is sent and received between Y2 and Avalara. If so, then the endpoint for sending the data should be entered in this field. However, this functionality is unlikely to be required when using the Tax Engine with SalesExternal as the external POS system should normally save this data.
Url	For Avalara customers, this field should be null.
Message	Always null
taxCodesMapping	For Avalara installations, the link needs to be made between the Y2 tax codes and the Avalara tax codes. For example, if you have a tax code 001 in Y2 which corresponds to 12345678 in Avalara, and another tax code 002 in Y2 which corresponds to 98765432 in Avalara, the field should look like this: [{"y2":"001","avalara":"12345678"},{"y2":"002","avalara":"98765432"}]
defaultTaxModel	Default value to return as TaxModel when computing taxes

defaultRegion	Default value to return as Region when computing taxes
defaultTaxId	Default value to return as TaxId when computing taxes
commitRequired	This parameter will indicate to the SalesExternal plugin used by LiveStore that an extra call needs to be done at the end of the ticket lifecycle to record the transaction for reporting purposes
HarmonizeCanadaTaxes	true/false. If this value is false and taxes are calculated in Canada (jurisName in TaxDetails is "CANADA"), then the tax returned contains the details of the different rates. In other cases, the tax returned is "harmonized" on a single line and rate of tax.
defaultCustomerCode.	Default value for CustomerCode when it is not provided in the SaaS connector request.

Body example

```
{
   "commitRequired": true,
   "companyCode": "cgdny",
   "user": "asahu@cegid.com",
   "password": "***",
   "isSandbox": true,
   "putCustomDataUrl": "https://aps832001fun001-customdata-
test.azurewebsites.net/api/TENANT/custom-data/receipt/[receipt_id]/keys/tax-
exemption-ref",
   "taxCodesMapping": [
      {
         "y2": "001",
         "avalara": "NOR"
      },
      {
         "y2": "NOR",
         "avalara": "NOR"
      }
   ],
}
```

Avalara Connector GET Settings Endpoint

SaaS instance environment

GET https://retail-connectors.cegid.cloud/[et or t or ep or p]/avalara/GetSettings?tenant=[TENANT] &profile=[PROFILENAME]

OnPrem instance environment

GET https://retail-connectors.cegid.cloud/[et or t or ep or p]/avalara/GetSettings?tenant=[TENANT]&onPremByPassApiKey=[APIKEY]&profile=[PROFILENAME]

See previous chapter for details on the query parameters.

The content returned is the same as the body of the Upsert call in the previous chapter.

4. Avalara Connector Tax Compute Endpoint

The format for the Avalara API endpoint is as follows.

SaaS instance environment
POST https://retail-connectors.cegid.cloud/[et or t or ep or p]/avalara/AvalaraCompute?tenant=[TENANT] &profile=[PROFILENAME]
OnPrem instance environment
POST https://retail-connectors.cegid.cloud/[et or t or ep or p]/avalara/AvalaraCompute?tenant=[TENANT]&onPremByPassApiKey=[APIKEY]&profile=[PROFILENAME]

See settings chapter for details on the query parameters.

The body and reply are identical to the GetTax operation on the TaxEngine.GetTax plugin. The descriptions are available on the swagger UI description of that operation.

Specific body contents

A few specific values can be provided in the compute body on top of the TaxEngine body requirements. The TaxEngine will provide these fields when calling the connector.

Commit Flag Logic
Transaction information can be saved in Avalara portal for reporting purposes. To save transactions commit flag is used.

- **commit=false**: Transactions are not saved in Avalara.
- **commit=true**: Transactions are saved in Avalara.

This feature requires the TaxEngine version 24.0.7.8

If running through the SalesExternal plugin (the /receipt API), version 24.0.5.108 is required.

DocCode

- When **commit=true**, the **DocCode** field is mandatory. You must provide a valid value for DocCode along with other transaction details to successfully save the transaction in Avalara.

5. Breaking Changes

This section lists evolutions which are not backward compatible, and therefore require an evolution on third party integrated systems.

There are no elements in this list yet.

6. Versions

Version 0.0.100

Delivered with package 24.0.3

New Features

- Ref. CEGID : 1465632
  - Added the ability for the connector to receive a request with a commit parameter and a document id, for the client to be able to use the Avalara tax reporting features.

Version 0.0.105

Delivered with package 24.0.4

This version only contains technical evolutions to improve the robustness of the module.

Version 0.0.108

Delivered with package 24.0.4

Version 0.0.112

Delivered with package 24.0.4

New Features

- Ref. CEGID : 1588685
  - Ability to manage multiple settings per tenant.

Version 0.0.121

New Features

- Ref. CEGID : 1638234
  - Support multiple levels of taxes in Canada

Version 0.0.131

Delivered with package 25.0.2

Ref. CEGID : 1777922,1782065

- **DefaultCustomerCode**
  - The Avalara SaaS Connector has been enhanced to support a default customer code, which can be configured in the settings. If a customer code is not provided in the request from tax engine, the default value from the settings will be used.
  - defaultCustomerCode is now configurable in upsert settings.
- **The country Id and jurisdiction Name Fields have been Added to the response payload.**
  - "countryISO2": "CA",
  - "countryISO3A": "CAN",
  - "countryISO3N": "124",
  - "jurisName": "CANADA"
- **Corrected the 'rate' and 'taxId' values in the response for Canadian taxes.**

Version 0.0.159

Delivered with package 25.0.4

Ref. CEGID : Feature 1909802

- The connector now manages a customer tax exemption reference that is submitted to Avalara for tax-exempt sales.
- Change in Avalara connector to support tax exemption by passing the CustomerTaxExemptionReference in the Avalara SaaS Connector Request.

Ref. CEGID : Feature 1909803

- Avalara request header needs to include a subscription key as per Avalara new requirements (the second value out of the four now contains a hardcoded subscription key)

Ref. CEGID : Bug 1842642

- In the case of multiple tax lines, the rank value and the order were not managed properly. This applied in particular in a Canadian context with the “GST/TPS” and “PST” taxes.
